

iThermo4all

It is a device designed to control your heating system from your smartphone, PC or your browser. iThermo4all is able to connect to your Wi-Fi router with secure protocols WEP/WPA/WPA2.

Through the app for iOS or application for Windows systems, you can completely control your thermostat, also once set up you can perform the same operations through the website. You will have the control in the palm of your air conditioning system.

The advantages of this technology are obvious: convenience, control, comfort and energy savings!

Our thermostat uses a WiFi network 802.11b standard, which allows it to be compatible with most routers. Also, if you do not have a WiFi router, the thermostat is able to create its own network to connect with your devices, without needing a WiFi router.

The thermostat can also work without the Internet connection, but in that case you can not control your thermostat when you're not at home.

The iThermo4all programmable thermostat is designed to ensure ideal temperature conditions at any time of the day and for each day of the week.

- Power supply: 90-220Vac 50/60Hz
- 4 operating modes: Manual, Automatic, Jolly, Holidays
- Functions Winter and Summer
- Setting range: from +5 ° C to +40 ° C.
- Programming: 24 temperature levels for each day of the week.
- Accuracy: ± 0.3 ° C.
- Dimensions: 120x80x26 mm.

The thermostat should be installed in the presence of electrical connection, because it is not equipped with batteries.

It's time to change your thermostat and take control of your heating system from anywhere.
